G54GAM - Games

Multiplayer Games

Lag

- Network delays lead to logical Inconsistencies
- A player shoots at another player
 - The player/client thinks they hit
 - The **fire** command takes some time to get to the server
 - The server thinks the player missed
- Two players try to pick up the same gold
 - We both arrived at the gold at the same time
 - Who picked up the gold?
 - We both did, we both saw that we did
 - Who gets to keep it?

Lag

- Implementation needs to have
 - Speed (otherwise it feels slow and jerky)
 - Synchronisation (to avoid logical inconsistencies)
 - Not use too much bandwidth (remember dial-up)
 - Cope with packet loss
- Client prediction
- · Entity interpolation
- · Lag compensation

Entity Interpolation

- Client is responsible for frame-to-frame movement simulation and rendering
 - $\boldsymbol{-}$ X is moving at speed Y with direction Z, so move it a bit
 - 100Hz
- Server is responsible for the bigger picture, the context and the consequences
 - X has picked up the gold, Y hasn't
 - X has fired a gun and hit Y
 - X has pressed UP so start them moving
 - 20Hz

Lag Compensation

- · Dead Reckoning
 - X is moving at speed Y
 - We haven't received a snapshot but need to draw a frame, so move it a bit ourselves
 - It's likely that X will continue to move at speed Y because there's nothing near it
 - ...allows smoother graphics than the network allows
- Deltas
 - Only tell the client what has changed, rather than send the full model snapshot
 - Send full snapshot after a network delay so that the client gets back in sync
 - ...reduces bandwidth use

Client Prediction

- · The player pressed up
- Send the command to the server controller
- While we're waiting for the updated snapshot, start moving anyway
- Rewind if we got it wrong
- ...the game feels more responsive than the network allows

Server-side Lag Compensation

- The server keeps a record of current round-trip-time for all the clients (time for a packet to travel from client->server->client)
- Remember where everything was up to a second ago
- When a new command is received, estimate when it was sent rather than when it was received
- Use a historical snapshot of the model to work out what happened
- ...the command is executed hopefully as if there was no lag

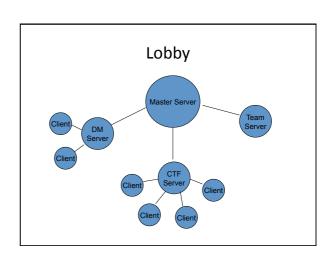

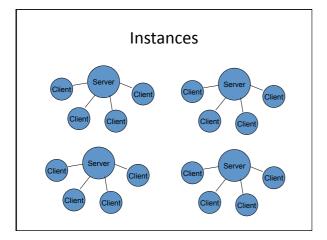

Scalability

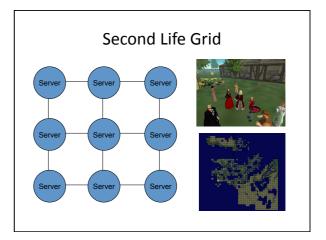

- · Basic client server model
 - Is reasonable for small numbers of players
- · Second Life
 - 15 million registered accounts
 - Average 10000 players at any one time?
- World of Warcraft
 - 11 million paying subscribers

Scalability

- Moderated Awareness
 - Server(s) maintains the complete model for all players
 - Client receives only a subset of the model relevant to the player
 - Where the player is and what is nearby
- Lobbies
 - A master server maintains a browse-able list of all active servers that a player can join
- Instances
 - Multiple identical instances of the server model
 - Each player inhabits only one
 - Create new instances as required
- ...can make the game bigger by adding more server hardware, does not affect the clients

Social Challenges

Different Attitudes to the Game

- Degree of lusory attitude
 - Taking pleasure in playing the game
 - Accepting that rules lead to limitations
 - Accepting the rules as play is an end in itself
- Relationship to the rules
 - How much the player adheres to the rules
 - Operational the formal rules
 - Implicit the social rules
 - Acknowledges the authority of the rules
 - Can/should they be broken?
- Interest in winning
 - How much the player wants to win

Types of Players

- Standard Player
 - Possesses lusory attitude
 - Acknowledges authority of the rules
 - Typical interest in winning
- Dedicated Player
- Unsportsmanlike Player
- Cheat
- Spoil-Sport

Types of Players

- · Standard Player
- Dedicated Player
 - Extra-zealous lusory attitude
 - Special interest in understanding and mastering the rules
 - Intense interest in winning
- Unsportsmanlike Player
- Cheat
- Spoil-Sport

Types of Players

- Standard Player
- · Dedicated Player
- Unsportsmanlike Player
 - Sometimes dedicated, sometimes a cheat
 - Adheres to operational rules, violates implicit
 - Intense interest in winning
- Cheat
- Spoil-Sport

Types of Players

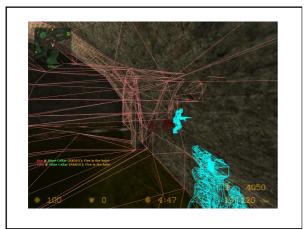

- Standard Player
- Dedicated Player
- Unsportsmanlike Player
- Cheat
 - Pretends to possess lusory attitude
 - Violates operational rules in secret
 - Intense interest in winning
- Spoil-Sport

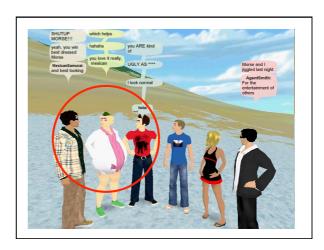

Types of Players

- Standard Player
- · Dedicated Player
- Unsportsmanlike Player
- Cheat
- Spoil-Sport / Griefer
 - No pretense about lack of lusory attitude
 - No interest in adhering to any rules
 - No interest in winning

Breaking the Rules

- A big problem in online games
- Making use of dominant strategies in order to win
 - Standard player vs dedicated player
 - Trick jumping, camping, weapon imbalances, short cuts
- · Breaking operational rules
 - Hacking the client
 - Using bots to automate play
- Breaking implicit rules
 - Multiple concurrent sessions
 - Killing team members / Spying for the other team
 - Subverting game economy ("gold farming")
 - Disrupting the play of other players

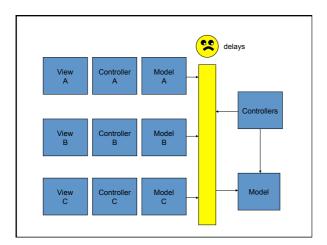

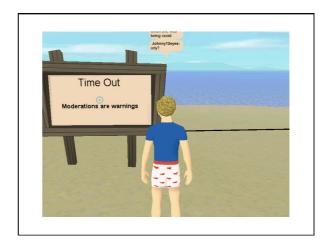

Reducing Rule Breaking

- Sanctioned Cheating
 - Make cheating a form of game play
 - Difficult to maintain meaningful play
- Formalise implicit rules as operational rules
 - Violations are punished within the scope of the game
 - Killing a team-mate = lose a point
 - Gold farming
 - Violates EULA ("operational rule")
 - Account is banned

Reducing Rule Breaking

- Technical Measures
 - Never trust the client
 - Attempt to hinder the use of bots / client hacks
 - PunkBuster / The Warden / Valve Anti-Cheat System et al search the clients memory for known hacks, scripts, behaviours
 - Impossible to completely stop client hacking
 - Occasionally punishes innocent players
 - Ban offenders by email, IP address and MAC address
- · Social Measures
 - Player empowerment
 - Allow players to vote out or mute offensive players
 - $-\ \ \mbox{Employ}$ moderators to police the game
