Define Archetype Stencils

Knowledge Gathering

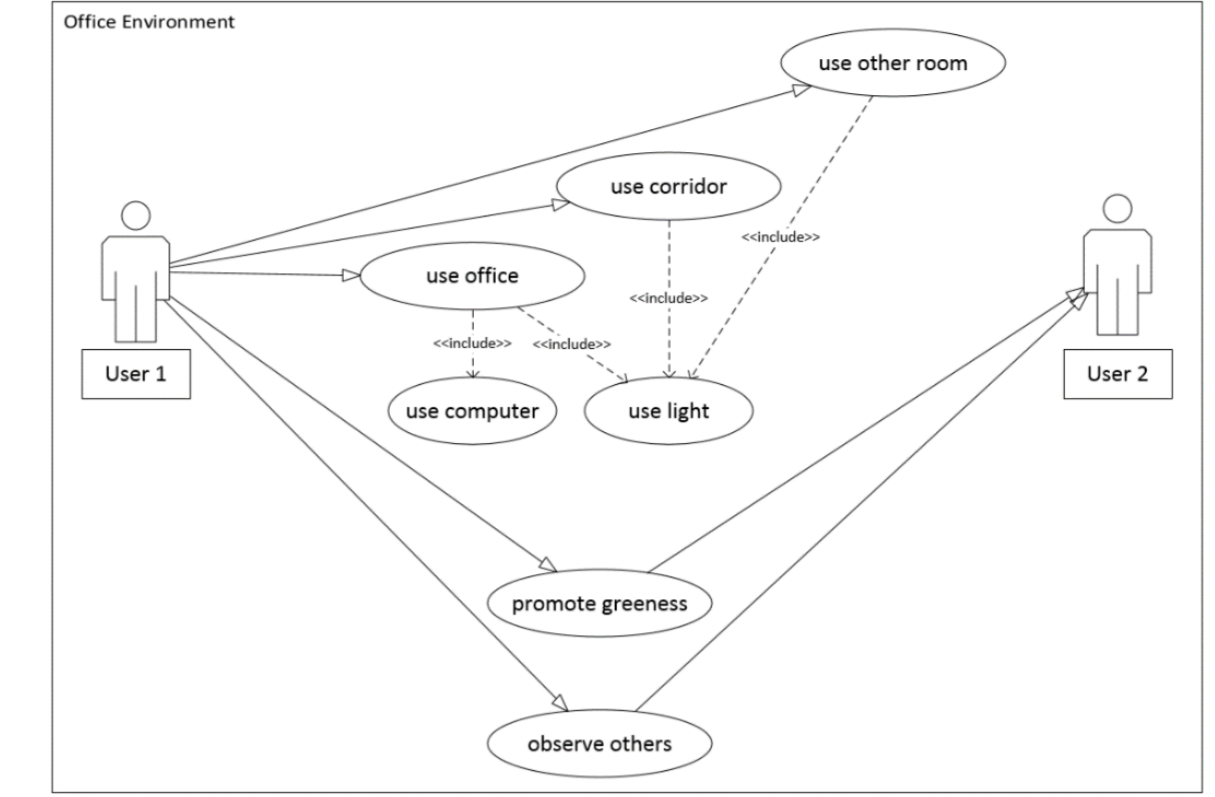

- Focus groups:
 - Facilitator from
 - Computer Science
 - Participants consisted of a mixture of academics and researchers from
 - Computer Science
 - Business Management
 - Psychology
 - We did not engage with business partners
 - Five core members that would participate regularly in the focus groups

- Aim
 - Study normative comparison in an office environment
- Objectives
 - Answer the following questions:
 - What are the effects of having the community influencing the individual?
 - What is the extent of impact (significant or not)?
 - Can we optimise it using certain interventions?
- Hypotheses
 - Peer pressure leads to greener behaviour
 - Peer pressure has a positive effect on energy saving
- Experimental factors
 - Initial population composition (categorised by greenness of behaviour)
 - Level of peer pressure ("individual apportionment" vs. "group apportionment")
- Responses
 - Actual population composition (capturing changes in greenness of behaviour)
 - Energy consumption (of individuals and at average)

- Scope
 - After some discussions within the focus group we decided that "transparency" would be the key driver for our decision making and that we want to abstract/simplify as much as possible while still keeping a realistic model
 - In order to have easy access to data we decided to use our own offices as the data source

- System boundaries
 - Building boundaries of the office environment

Category	Element	Decision	Justification
Actor	Staff	Include as group (User)	Regularly occupy the office building
	Research fellows	Exclude	Insignificant energy use
	PHD students	Exclude	Do not have control over their work environment
Physical Environment	HVAC (Heating + Ventilation + Aircon) system	Exclude	We only need one major energy consumer to test the theory; we decided to go for electricity
	Lighting	Include	Interacts with users on a daily basis; controlled by user
	Computer	Include	Interacts with users on a daily basis; controlled by user
	Monitor	Exclude	Modelled as part of the computer
	Continuously running appliances	Exclude	Constant consumption of electricity; not controllable by individuals
	Personal appliances	Exclude	No way to measure consumption
	Temperature	Exclude	Not necessary for proof-of-principle
	Natural light level	Exclude	Not necessary for proof-of-principle
	Office	Include	Location where electronic appliances are installed
	Lab	Exclude	Mainly used by UG/MSc
Room	Kitchen	Include as group (Other Room)	Common areas frequently used by "users"
	Toilet	Exclude	
	Corridor	Include	Commonly used when "users" move around
Social / Psychological Aspect	Comparative feedback	Include	Effective strategy to reduce energy consumption in residential building
	Informative feedback	Include	Effective strategy to remove barriers in performing specific behaviour
	Apportionment level	Include	Potential strategy to reduce energy consumption in office building
	Freeriding	Include	Behaviour that differentiate two apportionment strategy
	Sanction	Include	Factor to encounter freeriding behaviour
Anonymity	Include	Factor to encounter freeriding behaviour	

- We identified two categories
 - Habits for work time
 - Arrival time at office
 - Leaving time from office
 - Habits for Energy Saving Awareness
 - Energy saving awareness
 - Likelihood of switching off unused electric appliances
 - Likelihood of promoting greenness
- A survey was conducted asking our research group members

Archetype	Working days	Arrival time	Leave time
Early bird	Mon-Fri	8am-9am	4pm-7pm
Time table compiler	Mon-Fri	9am-10am	5pm-6pm
Flexible worker	Mon-Fri	10am-1pm	5pm-11pm
Hardcore worker	Mon-Fri + Sat	8am-10am	5pm-11pm

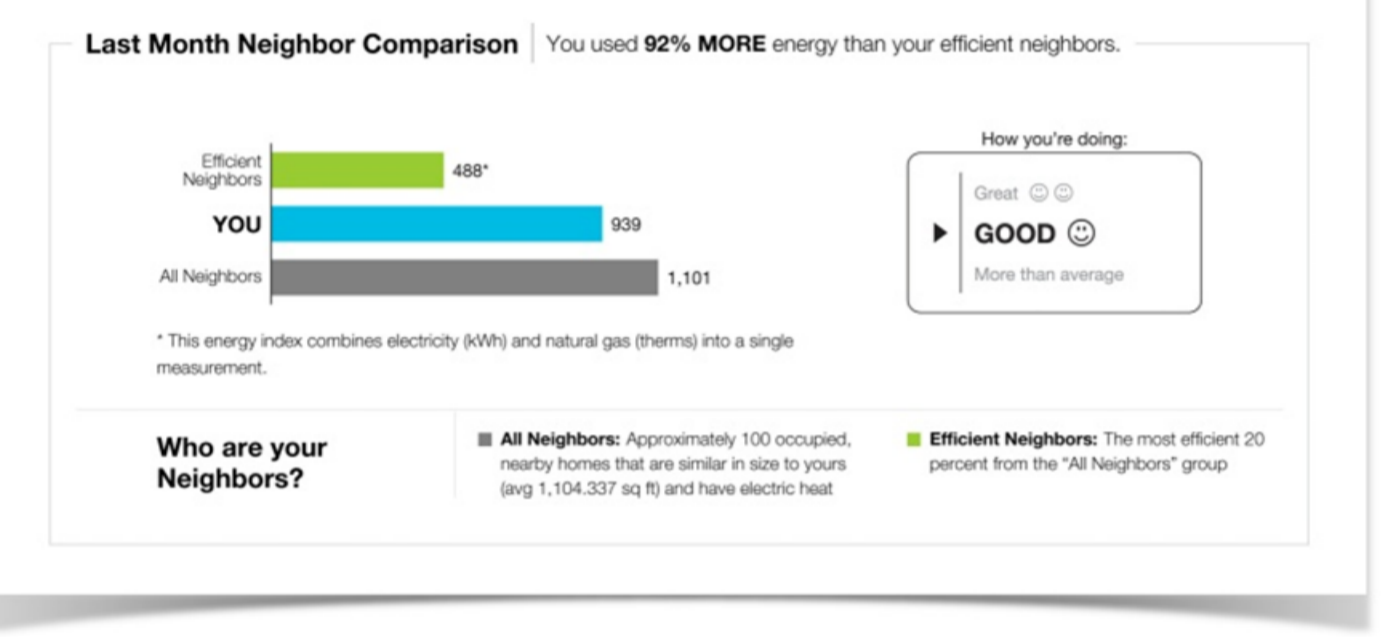

Archetype	Energy saving awareness (0-100)	Probability of switching off unnecessary appliances	Probability of sending emails about energy issues to others
Environmental champion	95-100	0.95	0.9
Energy saver	70-94	0.7	0.6
Regular user	30-69	0.4	0.2
Big user	0-29	0.2	0.05

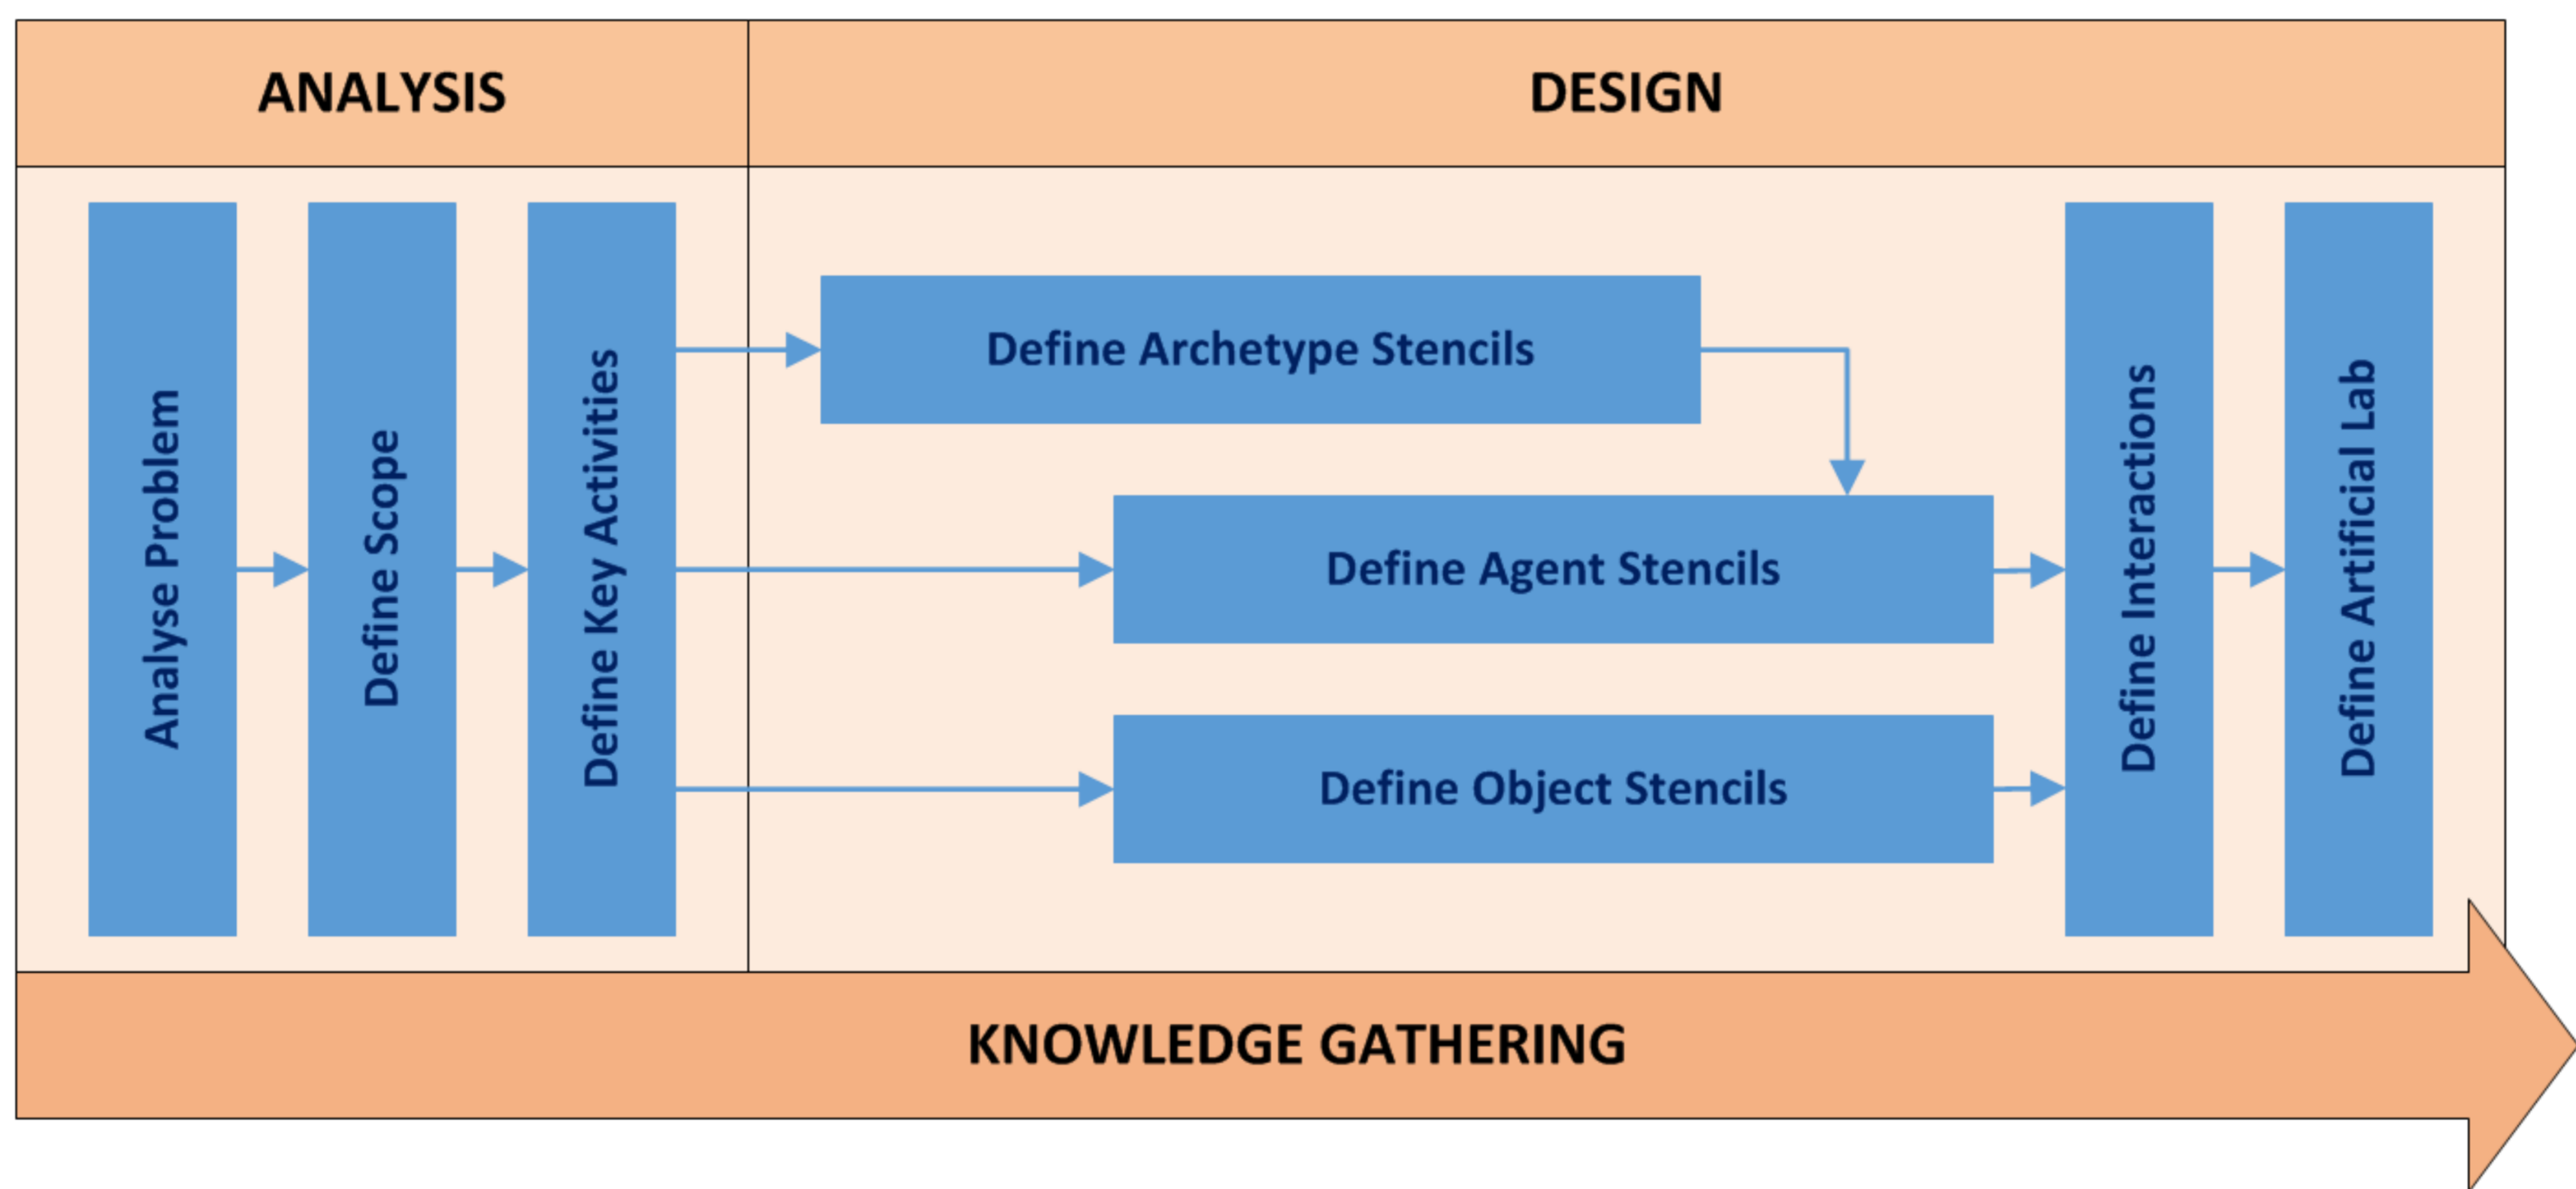

Agents to the Rescue: Creating Artificial Labs for Evaluating Human-Centric and Coupled Human-Natural Systems

Peer-Olaf Siebers : School of Computer Science : Nottingham University : peer-olaf.siebers@nottingham.ac.uk

- Studying the impact of normative comparison amongst colleagues with regards to energy consumption in an office environment

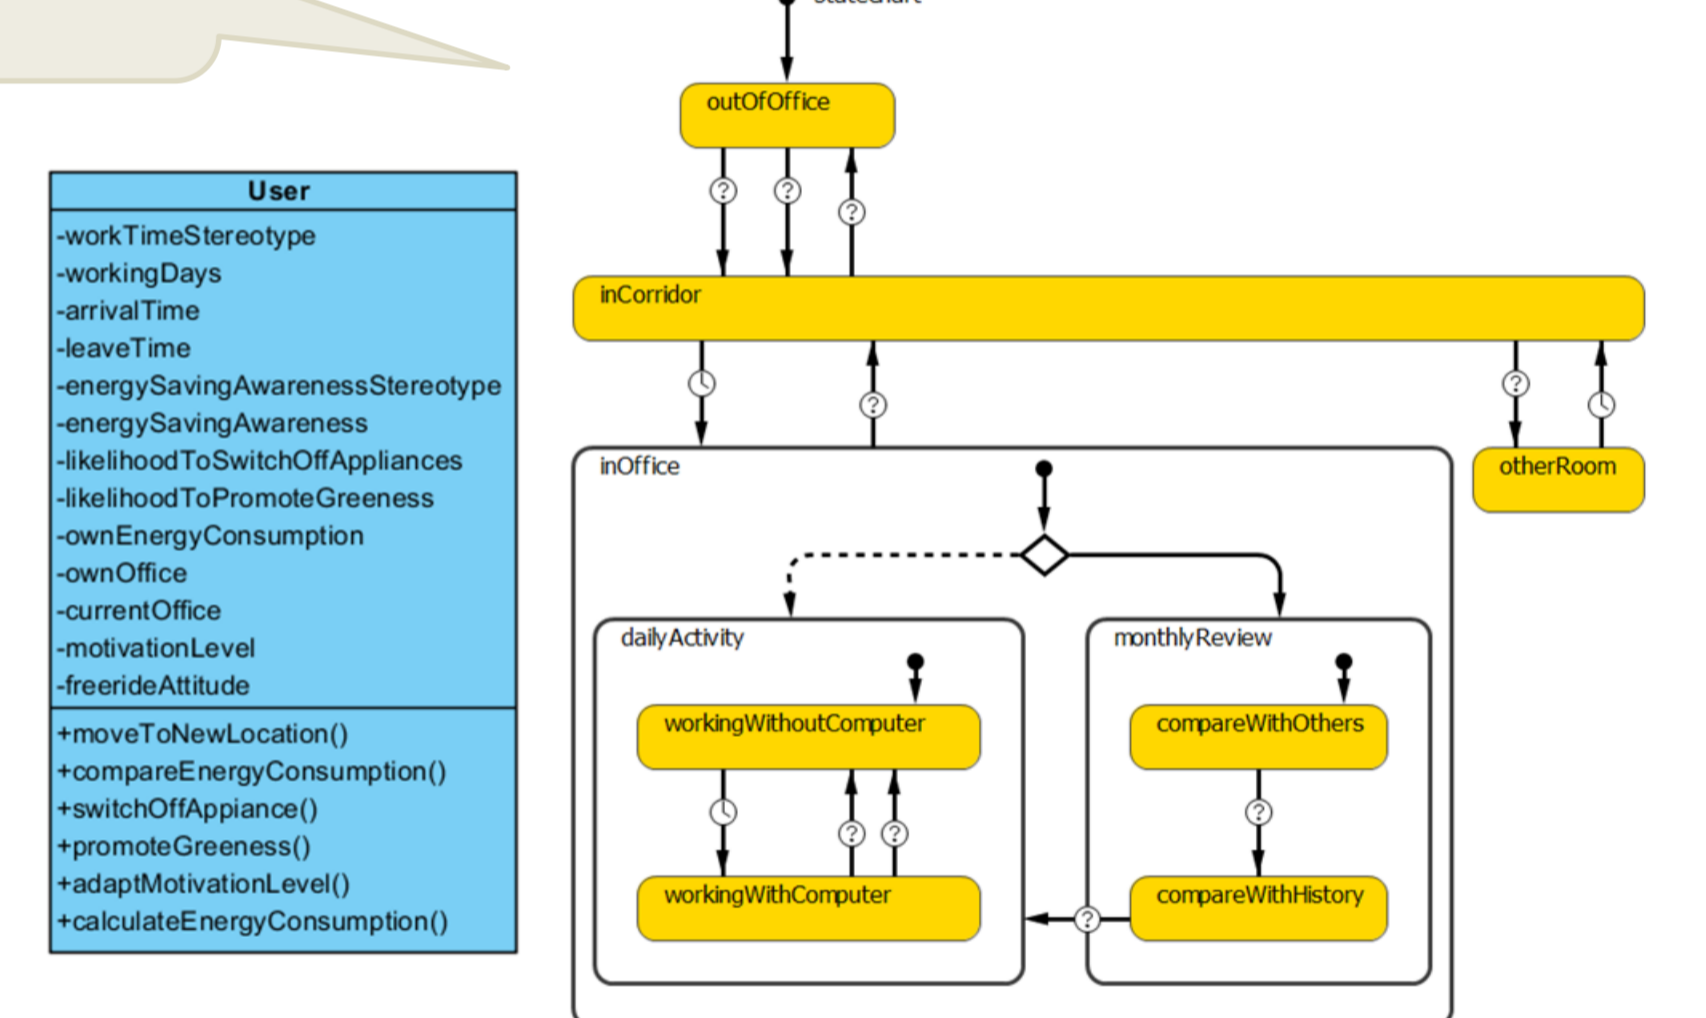

For more information see: Siebers PO and Klugl F (2017) 'What Software Engineering has to offer to Agent-Based Social Simulation'. In: Edmonds B and Meyer R (Eds). Simulating Social Complexity: A Handbook - 2e

How to embed qualitative and quantitative evidence?

Define Agent/Object Stencils

From state	To state	Triggered by	When?
outOffice	inCorridor	Condition	At typical arrival time during the working week for all
outOffice	inCorridor	Condition	At typical arrival time on Saturdays for hard-core workers only
inCorridor	outOffice	Condition	At typical leave time
inCorridor	inOffice	Timeout	At average after 5 minutes
inOffice	inCorridor	Condition	At random while at work or when leaving
inCorridor	otherRoom	Condition	At random while at work
otherRoom	inCorridor	Timeout	At average after 10 minutes

Anecdotal evidence suggests that the Agent-Based Social Simulation community suffers from a lack of structured and standardised ways for model development. For multi-disciplinary projects with academic and non academic collaborators this issue becomes even more evident.

We have created a model development strategy that employs the Engineering Agent Based Social Simulation framework (or EABSS for short). It is grounded on the concept of co-creation and ideas from Software Engineering. We drive the qualitative information gathering process through focus groups, using predefined table templates and the Unified Modelling Language (UML) as main forms of stimulating and documenting the contributions of all participants.

The strategy has been used for two purposes: for collaborative model development and to stimulate and formally support discussions. We have tested the framework in several domains, including Architecture, Geography, Organisational Behavior, and Mental Health.

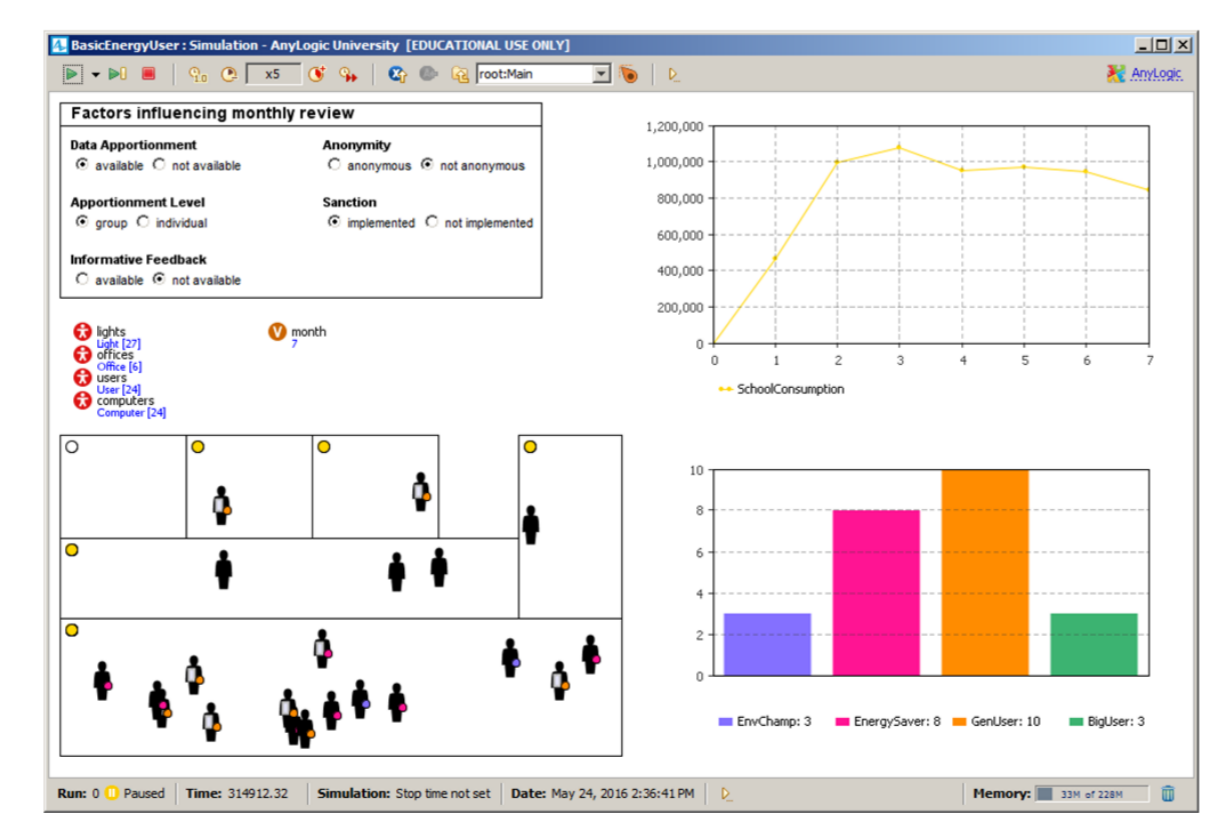

While we understand the model development process very well, we often struggle when it comes to working out how to embed relevant qualitative and quantitative evidence into our models. It is easy said on a high level what is relevant (e.g. by referring to a well-established theory), but how to add it practically, is often difficult to work out.

We would like to use the workshop to come up with a strategic extension that can guide the users of the framework with embedding qualitative and quantitative evidence into the models they develop.

Experiment with the Model

Implement the Model

Define Artificial Lab

- We need to consider things like:
 - Global variables
 - e.g. to collect statistics
 - Compound variables
 - e.g. to store a collection of agents and objects
 - Global functions
 - e.g. to read/write to a file

```

Artificial Lab
-#SchoolEnergyConsumption
-#numEnvironmentalChampions
-#numEnergySavers
-#numGeneralUsers
-#numBigUsers
-#DataApportionmentAvailable
-#ApportionmentLevelGroup
-#InformativeFeedbackAvailable
-#AnonymityGiven
-#SanctionImplemented
-#users[]
-#office[]
-#lights[]
-#computers[]
+calculateSchoolConsumption()
+writeDataToFile()
+findOffice()
    
```

Define Interactions
